

d. a base station controller operatively connected to the transceiver array  
and switching circuit for:

- i) monitoring channel utilization in each sector of the cell, and  
determining the loading in each sector;
- ii) reassigning a channel from a first sector in a cell to a second  
sector in the same cell when the loading in the first sector reaches a  
predetermined threshold; and
- iii) switching the transceiver corresponding to the reassigned channel  
from the second sector to the first sector.
-
